

**AN
INTERNSHIP REPORT
ON
PHARMACY MANAGEMENT SYSTEM
PROJECT
BY
KAMAL ACHARYA
(Tribhuvan University)**

Date: 2020/03/10

1. INTRODUCTION

1.1 ABOUT THE PROJECT

The Project entitled “**PHARMACY MANAGEMENT SYSTEM**” is systematic approach made towards maintaining purchase details, stock details, order details, sales details, sales return details, payment details, buyer details, the record are manually maintained id’s provide lots of problem. Hence we need of data to be computerized.

The projects consists of four modules namely

- Master Module
- Transaction Module
- Order Module
- Report Module

This Master module has of Buyer form, supplier form, product information’s form; purchase form, stock form, sales form, sales return form, and payment detail form are also maintained within this. Purchase Form deal with purchase order of Medicine based on the stock. The level is increased when some purchase can be done and it can be monitored frequently by the stock.

Stock Form deals with the details of the stock maintained in the stores. The system provide some message to indicate if the stock reach its level and tit is easy tom increase level of the stock. The system can increase its stock level when some purchase and sales return is done and its stock reduces level some sales done.

Sales Details deals with sales order of medicine based on the stock, the level is decreased when some sales can be done and it can be monitored frequently by the stock level. The sales return details system can increase the stock level when some sales return.

Transaction Module maintains Buyer and Order process. Buyer process deals with the information about the buyer are differentiated us regular Buyer or new Buyer. The

regular buyer is provided by special offer discount. This helps to motivate some of new buyer to become a regular buyer.

Order process deals with the order which is given by buyer. Every order is separately stored.

Purchaser Report

Stock Report

Sales Report

Order Report

The reports are generating automatically. This is maintained and calculated accurately. The reports are displayed in neat formats. The Buyer, supplier, sales purchase sales, sales return, purchase return and stock will have a separate report.

1.2 HARDWARE SPECIFICATION

Processor Name	:	Pentium Dual Core
Speed	:	2.664 GHz
Main Memory	:	512 MB
Cache Memory	:	1024 KB
Hard Disk	:	80 GB
Keyboard	:	110 Keys
Mouse	:	Optical Mouse
Monitor	:	15'' CRT Color Monitor

1.3 SOFTWARE SPECIFICATION

Front-End	:	Visual Basic 6.0
Back-End	:	MS Access 2000
Operating System	:	Windows 2000 Professional

About Software

Introduction to Visual Basic 6.0

Visual Basic 6.0 is an ideal programming language for developing sophisticated professional applications for Microsoft windows. It makes use of Graphical user Interface (GUI) for creating robust and powerful applications. The GUI as the name suggests, uses illustrations for text, which enable users to Interact with an application. This feature makes it easier to comprehend things in a quicker and easier way. In a GUI environment, the number of options open to the user is much greater, allowing more freedom to the user and developer.

The language selected to develop the software should satisfy the following requirements:

- It should be useful for developing application software
- User-friendly package
- Ability to manipulate files in minimum level
- Easy access of database
- Easy access of reports

Features of Visual Basic 6.0:

The features included newly in Visual Basic 6.0 are,

- Own Visual basic Code
- Create ActiveX Controls
- Multithreaded Document Link Library's
- Internal Transfer Control
- Join Photograph Expert Group and GIF support
- Create ActiveX Document
- Main Document Interface / Single Document Interface / Explorer – style Interface options
- Code Editor Enhancements
- Global Objects, Object Link Enabled Drag and Drop
- Open Database Connectivity Direct
- Dock able and Linkable windows, Toolbox and Toolbars
- Declare, Raise and Handle Events and etc.

Visual Basic 6.0 Window:

Visual Basic 6.0 Interface consists of a form, toolbar, toolbox, menu, menu bar, project explorer and properties window. Programming in Visual Basic 6.0 consists of a visual programming step that involves designing its application and a code Programming step that involves coding. Visual Basic 6.0 uses building blocks such as variables, data files, procedures, functions and control structures in its programming environment.

Data report:

Data report is a powerful yet easy to use program for creating custom reports lists and forms letters using data from existing database.

Using with Visual Basic:

Data reports Visual Basic 6.0 can also be used to prInt reports from within Visual Basic 6.0 code with the help of data custom control.

Textbox

The text box is the standard control that is used to receive input from the user as well as to display the output.

Label

The label is a very useful control for Visual Basic 6.0, as it is not only used to provide instructions and guides to the users, it can also be used to display outputs.

Command Button

The command button is a very important control as it is used to execute commands. It displays an illusion that the button is pressed when the user click on it.

The Image Box

The image box is another control that handles images and pictures. It functions almost identically to the picture box. However, there is one major difference, the image in an image box is stretchable, which means it can be resized.

The List Box

The function of the List Box is to present a list of items where the user can click and select the items from the list.

The Combo Box

The function of the Combo Box is also to present a list of items where the user can click and select the items from the list. However, the user needs to click on the small arrow head on the right of the combo box to see the items which are presented in a drop-down list. In order to add items to the list, you can also use the add item method.

Data Environment

The Data Environment designer provides an Interactive, design-time environment for creating ActiveX Data objects. These can be used as a data source for data-aware object on a form or report, or accessed programmatically as methods and properties exposed of the Data Environment object.

Visual Basic 6.0 powerful, sophisticated applications that exploit the key features of MS-WINDOWS, including Multiple Document Interfaces (MDI), Object Linking and Embedding (OLE), Dynamic Data Exchange (DDE), Graphics and more are created.

Visual Basic 6.0 let the user to add Menus, Text Box, List Box, and Scroll Bar, File and Directory box to blank windows.

Visual Basic 6.0 also has an Intelligent Interpreter, Editor that often detects error and even suggests the changes to correct routine programming.

- User friendliness
- Easier comprehension
- Faster application development
- Introduction to Active X technology
- Develop robust stand-alone applications, games & utilities in less time that it takes in other languages
- Inter active screen handing facilities

INTRODUCTION TO MICROSOFT-ACCESS

Access is such a rich and powerful application that most people do not know where to begin when they start using it. Access makes it easy for users-even beginners to work with databases. You can create tables, edit data and se queries to find the data you want with little effort and access includes wizards that can do the work of designing data entry forms, reports and mailing labels for you.

NEW FEATURES IN MICROSOFT-ACCESS

Ms-access offers many new and improved features to help to create powerful data applications. New objects, properties, methods and other language elements. Ms-access provides an array of new and enhanced objects, methods, properties, functions, statements, data types and events to enable to create powerful data base application with Visual Basic 6.0.

- Creating custom object with class modules.
- Customizing menus and tool bars in your application.
- Removing source code from your application.
- Using new features in the module window.
- Creating a tabbed dialog box or multiple page from with the tab control.
- Setting references programmatically.
- Using the enhanced debug window.
- Improving complication performance

MICROSOFT-ACCESS ACCESSIBILITY

- Change the size of tool bar buttons.
- Add separator bars between group of tool bar buttons, menu commands or menus.
- Create a custom tool bar for the current database.
- Create a custom colors for a section or control on a form or report.
- Insert repeated entries in a column quickly.
- Work with auto correction.

2. SYSTEM STUDY

2.1 STUDY FOR THE EXISTING SYSTEM

System study plays an important role of software development life cycle where the present system is studied and requirement for the proposed system are finalized. In manual system it has many problems, the major difficulties manual systems are tedious. Referring the sales details of day-to-day process and calculating the transaction is very tedious. It requires more time, cost consuming and the mistakes may occur. It becomes a barrier of the bank. It has low accuracy. The requirements are not fulfilled in correct time. It yields more man power and maintenance cost is high in the fast moving world. While preparing reports, they have to refer an account of transaction book, this becomes a hard process.

DRAWBACKS OF THE EXISTING SYSTEM

- When the user uses ordinary system, it consumes more time.
- It needs more man power.
- Updating the Buyer details allocated section is not easy; hence it results in bad approaching manner of the bank.
- It works slowly.

2.1 NEED FOR THE PROPOSED SYSTEM

System analysis consists of two phases planning and requirement definition. They include understanding problem, performing feasibility study, developing recommended solution strategy and planning development process. System definition includes the modules for system study. System justification tells about system project and development environment.

2.3 OBJECTIVES OF THE PROPOSED SYSTEM

The proposed system has been developed to eliminate the above drawbacks. The manual operations are carried out using computers. The details of the members are stored in a database. Using these details, the daily transactions are updated and the management can view the details of the transaction tables, user balances are maintained and fuel rates can be changed in an appropriate way.

- To give a user friendly system.
- To reduce the processing time and large database can be easily maintained.
- Reduce manual errors and malpractices
- To increase growth and profit for the organization.

3. SYSTEM DESIGN

3.1 DATA FLOW DIAGRAM

E-R DIAGRAM

3.2 DATABASE STRUCTURE

Pharmacy Management System is developed using Access as Back end with several tables such as Buyer Details, Supplier Details, Medicine Purchase Details, Stock Details, Medicine Sales Details, Return Details,etc.

Table Name : Purchase

Purpose : This is used to store the Purchase details

Field Name	Type	Size	Constraints	Description
Mid	Number	4	Primary Key	Medicine Id
Mname	Text	20	Not Null	Medicine Name
Edate	Date/Time	10	Not Null	Expiry Date
Pfrom	Text	20	Not Null	Purchase From
PDates	Date/Time	10	Not Null	Purchase Date
Price	Number	7	Not Null	Price Per Quantity
Qty	Number	10	Not Null	Purchase Quantity
Tamt	Number	10	Not Null	Total Amount

Table Name : Purchase Return

Purpose : This is used to store the Purchase Return details

Field Name	Type	Size	Constraints	Description
Mid	Number	5	Foreign Key	Medicine Id
Rid	Number	5	Primary Key	Return Id
Pfrom	Text	20	Not Null	Purchase From
Mname	Text	20	Not Null	Medicine Name
Edate	Date/Time	10	Not Null	Expiry Date
Pqty	Number	10	Not Null	Purchase Quantity
Rqty	Number	10	Not Null	Return Quantity
Rdate	Date/Time	10	Not Null	Return Date
PDates	Date/Time	10	Not Null	Purchase Date

Table Name : Stock

Purpose : It Store the stock details

Field Name	Type	Size	Constraints	Description
Mid	Number	4	Foreign Key	Medicine Id
Mname	Text	20	Not Null	Medicine Name
Edate	Date/Time	10	Not Null	Expiry Date
Qty	Number	10	Not Null	Quality
Price	Number	17	Not Null	Price

Table Name : Sales

Purpose : It Store details about sales

Field Name	Type	Size	Constraints	Description
Sid	Number	5	Primary Key	Sales Id
Sdate	Date/Time	10	Not Null	Sales Date
Bid	Number	5	Not Null	Buyer Id
Bname	Text	20	Not Null	Buyer Name
Oid	Number	5	Not Null	Order Id
Mid	Text	5	Foreign Key	Medicine Id
Mname	Text	20	Not Null	Medicine Name
Qty	Number	10	Not Null	Quality
Price	Number	10	Not Null	Price Per Quantity
Tamt	Number	10	Not Null	Total Amount

Table Name : Sales Return

Purpose : It Store Sales Return Medicine details

Field Name	Type	Size	Constraints	Description
Sid	Number	5	Foreign Key	Sales Id
Rid	Number	5	Primary Key	Return Id
Bid	Number	5	Foreign Key	Buyer Id
Bname	Text	20	Not Null	Buyer Name
Mname	Text	20	Not Null	Medicine Name
Sqty	Number	10	Not Null	Sales Quality
Rqty	Number	10	Not Null	Return Quantity
Rdate	Number	20	Not Null	Return Date

Table Name : Payment

Purpose : It Store Payment details

Field Name	Type	Size	Constraints	Description
Bid	Number	10	Primary Key	Buyer Id
Mid	Text	5	Foreign Key	Medicine Id
Mname	Text	20	Not Null	Medicine Name
Price	Number	10	Not Null	Price Per Quantity
Qty	Number	10	Not Null	Quality
Tamt	Number	10	Not Null	Total Amount

Table Name : Order

Purpose : It Store the Order details

Field Name	Type	Size	Constraints	Description
Oid	Number	5	Primary Key	Order Id
Odate	Date/Time	10	Not Null	Order Date
Bid	Number	10	Not Null	Buyer Id
Bname	Text	25	Not Null	Buyer Name
Mid	Text	5	Foreign Key	Medicine Id
Mname	Text	25	Not Null	Medicine Name
Price	Number	10	Not Null	Per Qty Price
Oqty	Number	10	Not Null	Order Quality

Table Name : Buyer Details

Purpose : It Store Buyer details

Field Name	Type	Size	Constraints	Description
Bid	Number	10	Primary Key	Buyer Id
Bname	Text	25	Not Null	Buyer Name
City	Text	25	Not Null	City
Addr	Text	150	Not Null	Address
Email	Text	25	Not Null	E-Mail Id
cno	Number	13	Not Null	Contact Number

3.3 USER INTERFACE DESIGN

This design specifies the details of all forms and how it works. This project helps to perform a medicine store work and issuing medicine in an efficient and easy manner.

This project is designed with following modules.

- Master Module
- Transaction Module
- Order Module
- Report Module

Master Module

Master Module contains two forms via, Medicine Details, Buyer Details. Medicine details form is used to store all the details about the medicine. This form has medicine id, medicine name, expiry date, purchased from, purchased date, purchased quantity, per quantity price. This form also stores the purchasing details and supplier details.

The Buyer form is used to store the buyer or regular Buyer details, it will used to get particular Buyer phone number or address to deliver medicine. This form has Buyer id, Buyer name, address, country, contact number, email id. To view an existing Buyer details by changing Buyer id.

The end user can easily clear, adding new record, update an existing record and delete an unwanted records.

Transaction Module

The transaction module keeps all the daily activities in the pharmacy shop. This module has the following forms they are, medicine purchase details, medicine purchase return, sales, sales return, stock details, payment details.

The medicine purchase form is used to store the daily purchasing activities from supplier, this form contains supplier id, supplier name, medicine id, medicine name, number of quantity purchased, per quantity price, total amount, and purchasing date.

The stock will automatically update when the end user done a purchase, purchase return, sales, sales return.

The purchased product has any damage it will return to the supplier this details are stored Into the purchase return table, stock will decreased from existing stock details. The purchase return form contains purchase id, return id, supplier name, medicine name, expiry date purchased quantity, return quantity, return date, and remarks about the particular medicine.

The sales form is used to store the daily medicine sales details. If made sales the stocks will automatically reduced and sales details are stored Into the sales table. This form has sales id, sales date, Buyer id, Buyer name, order id, medicine name, order quantity, per quantity price, total amount. The total amount will automatically calculate by based on sales quantity and per quantity price.

The Buyer must order before sales, because the sales process only done by base order Buyer order details. The Buyer order details form contains order id, order date, Buyer id, Buyer name, requested medicine id, medicine name, per quantity price, order quantity.

Stock details are used to maintain the details such as stock id, medicine name, type of the medicine, total quantity. Purchased medicines are easily added to stock.

Report Module

This module will help to the end user to get all the details in hard copy format. It will created by visual basic data report. This module shows the result about medicine details, stock report, Buyer report, sales report, Buyer details, payment details, employee salary details.

4. SYSTEM TESTING & IMPLEMENTATION

SYSTEM TESTING

Testing Methodologies and Policy

Testing is an activity to verify that a correct system is being built and is performed with the Intent of finding faults in the system. However not restricted to being performed after the development phase is complete. But this is to carry out in parallel with all stages of system development, starting with requirement specification. Testing results once, gathered and evaluated, provide a qualitative indication of software quality and reliability and serve as a basis for design modification if required a project be set to be incomplete without proper testing.

System testing is a process of checking whether the development system is working according to the original objectives and requirements. The system should be tested experimentally with test data so as to ensure that the system works according to the required specification. When the system is found working, test it with actual data and check performance.

All tests should be traceable to Buyer requirements. The focus of testing will shift progressively from programs. Exhaustive testing is not possible. To be more effective, testing should be one, which has probability of finding errors.

The Following are the attributes of good test

- A good test has a high probability of finding an error
- A good test is not redundant.
- A good test should be “Best of Breed”.
- A good test should neither too simple nor too complex.

Levels of Testing

The details of the software functionality tests are given below

The testing procedures that has been used is as follows

- Unit Testing
- Validation Testing
- Output Testing
- Performance Testing

Unit Testing

The first level of testing is called as unit testing. Here the different modules are tested and the specifications produced during design for the modules. Unit testing is essential for verification of the goal and to the test the Internal logic of the modules. Unit test was conducted to the different modules of the project. Errors were noted down and corrected down immediately and the program clarity was increased the testing was carried out during the programming stage itself. In this step each module is found to be working satisfactory as regard to the expected output from the module. The modules like Buyer Module, Employee Module, Stock Module etc., were tested.

Validation Testing

The next level of testing is validation testing. Here the entire software is tested the reference document for this process is the requirement and the goal is to see if the software meets its requirements.

The requirement document reflects and determines whether the software function as the user expected. At the culmination of the Integration testing, software is completely assembled as a package, Interfacing and corrected and final serious of software test and validation test begins. The proposed system under construction has been tested by using validation testing and found to be working satisfactory. After finishing the Integration testing, the modules were tested for validation.

Output Testing

The output of the software should be acceptable to the system user. The output requirement is defined during the system analysis. Testing of the software system is done against the output requirements and the output testing was completed with success.

Performance Testing

This project is a system based project, and the modules are Interdependent with the other modules, so the testing cannot be done module by module. So the unit testing is not possible in the case of this driver. So this system is checked only with their performance to check their quality.

In case of the unit testing the initialization module is first tested. Since read module and the write module is Interdependent the performance testing is done.

SYSTEM IMPLEMENTATION

Implementation Procedures

Implementation phase is the last phase regarding any system development, before any system is implemented various tests are performed the system is reviewed thoroughly. The changeover selected is used to change the existing system to the new proposed system. In this phase, the system enters the operation and routine maintenance stage.

Operation Documentation

This system is developed in such a way that the existing system facilities are enough for implementation. The hardware facilities are sufficient enough to implement the developed system. The system has been successfully implemented in the organization with full co-operation of the management. The users assume their respective responsibilities.

User Training

This software is being implemented on parallel basis with the old manual system. As this new system is more users friendly and fast, the users get more accustomed with it. This reduces the usage of the old manual system by and by the old system is eliminated while the new system establishes itself. By following this method if there are any deformities in the system, it can be easily corrected by comparing with the old system.

Implementation denotes the process of converting a new or a received system design into an operation one. There are two aspects of implementation they are

- Implementation of a computer system to replace a manual system.
- Implementation of an easily manageable advanced system to replace the existing one.

This system imposes the first method where one can replace a manual operation with the computerized one. The tested system includes certain tasks while they may hold costs, risks and personal irritation to a minimum and it involves:

- Creating computer-compatible file.
- Training the operating staffs.
- Installing terminals and hardware.

5. CONCLUSION & SUGGESTIONS

CONCLUSION

This project is efficient and gives more flexibility to the user and the organization when comparing the manual system. This project has been aimed to minimize the burden of clerical work and eliminate human errors. The project covers all aspects of transaction that comes in process of managing pharmacy shop. This project has been providing efficient report generators which provide detail information about the consumer details, transactions and renewable reports.

By minimizing the work time of semi automated processing with highly interactive screen designs and report facilities, proposed system would work for a longer period in the company's business operation.

SUGGESTIONS

The project can further enhanced towards providing an additional features to the existing system when the data transaction takes place between the Buyer and the bank. Some of the suggested enhancements are

- Change of backend database to the latest one by that time for faster response time.
- Converting the single user system to a networked one, this enables multi user access.
- Introducing more facility in generating ad-hoc Buyer reports.
